

# Orchestrating the data pipeline

In this lab we will continue to work with [Glue](#) and convert the raw data we have extracted in [the previous lab](#) into a curated data set by making some aggregation.

**Please note:** this Lab depends on the steps executed in the [Transformation LAB](#); In case you didn't finish that one yet, now is the time :)

At this stage we have Glue Jobs configured to covert our raw data into Parquet. We should be able to observe 2 main folders in our data-lake bucket (raw and curated).

So far so good, however we'd probably like to automate this process and repeat it on a daily basis for example.

## Orchestrate the data pipeline using the Workflow feature

The plan is to create a pipeline, which will refresh the data-set every once in a while. The next steps assume you need to perform some jobs before running the others. However, if your transformation jobs can run in parallel, feel free to add them in parallel in the pipeline. An example of dependent jobs would be if you

have jobs that extracts data from other source and ingest it into your data lake before kicking off another transformation jobs.

Let's navigate to the *Workflows* in the *ETL* section on the left side-pane.

[Workflows](#) > [Add workflow](#)

## Add a new ETL workflow

Add a workflow in order to orchestrate ETL jobs, triggers, and crawlers

### Workflow name

sportstickets-workflow

Names may only contain letters (A-Z), numbers (0-9), hyphens (-), or underscores (\_)

### Description (optional)

Enter a workflow description...

250 characters max

### Default run properties (optional)

No default run properties

[Add property](#)

[Cancel](#)

[Add workflow](#)

- we start by clicking on the **Add Workflow** button;
- add a name for our workflow (e.g. `sportstickets-wf` ) and press the **Add Workflow** button;

✓ Successfully created workflow: sportstickets-workflow. ✕

## Workflows (1)

A workflow is an orchestration used to visualize and manage the relationship and execution of multiple triggers, jobs and crawlers.

Name	Last run	Last run status	Last modified
 sportstickets-workflow	-	-	Sat, 19 Oct 2019

Graph

Details

History

**Legend:** ● Start ◆ Trigger □ Job ▣ Crawler ⚡ Incomplete ✖ Error ⌛ Deleting

The workflow is empty

Add trigger

Once the workflow is created add the first trigger to it.

Add trigger

Clone existing

Add new

Name

Description (optional)

Type description...

Trigger type

☒ Schedule ☐ Event ☐ On demand

Frequency

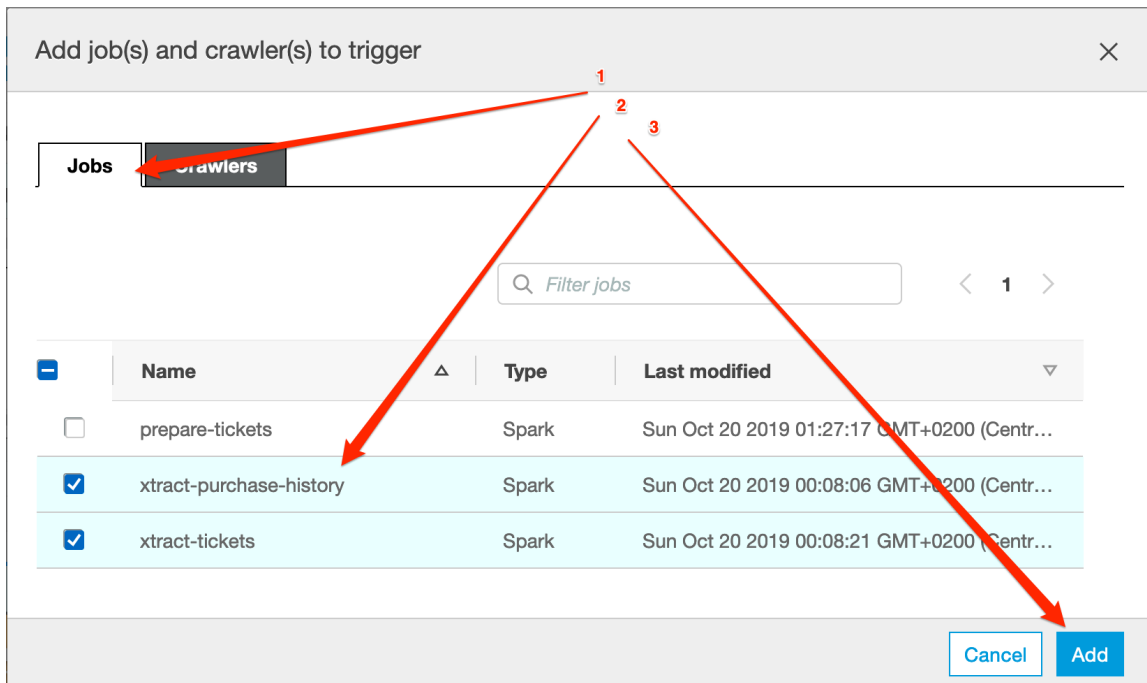

Cancel

Add

- make sure you selected the *Add New* tab;
- define a *Name* for the new trigger ( `transform-data` );

- specify the *Frequency* before you press **Add** (let's say you run this workflow at the 30th minute of every hour);

Start by clicking on the newly created trigger, then add the needed jobs to it (that will run in parallel).

## Adding dependent jobs (Optional)

Next we add one more trigger to start the aggregation as soon the ingestion is finished. Let's start by clicking on the **Add trigger** option in the top right corner of the workflow editor.

Make sure that you select the *Add new* tab and **Event** as a *Trigger type*. Let's call our trigger `transform`. Don't save it just yet:

Add trigger

Clone existing

Add new

1

2

3

Name

transform

Description (optional)

Type description...

Trigger type

☐ Schedule ☒ Event ☐ On demand

Trigger logic

Cancel

Add

Scroll down and select the *“Start after ALL watched event”* option at the *Trigger Logic*. This will make sure that we will only trigger the aggregation job, once all the ingestion jobs are finished.

Trigger type

☐ Schedule ☒ Event ☐ On demand

Trigger logic

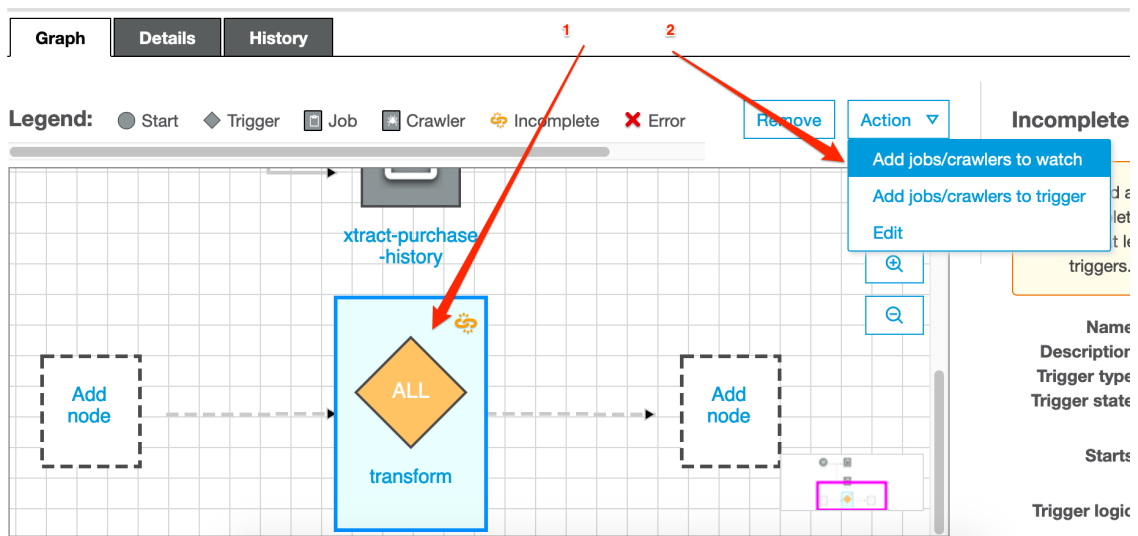

☐ Start after ANY watched event ☒ Start after ALL watched event

Cancel

Add

Now we have a trigger, we just need 2 more steps:

- add the dependency jobs (the ones to be watched)
- add the job which needs to be triggered once all watched ones are completed;

Select the jobs that need to run first, make sure that we're watching for the **SUCCEEDED** event and push **Add**.

Add job(s) and crawler(s) to watch ✕

Add

We are almost there, however there's one more thing: the data we just generated is not available in the data catalog for wider audiences. Let's configure a one more crawler for our curated data and add it to the workflow.

## Register the staged data tables in the data catalog

Navigate to the **Crawlers** section in the left pane and press **Add crawler**.

- at the name specify: *{choose-name}\_curated*;
- at the source types leave the default *Data stores* option;
- in the data-store section leave the default *S3* and the *Specified path in my account*.
- now select your curated folder: *s3://datalake-xxxxyyyyzzzzz/curated*
- at the *Choose an IAM role* section choose the *glue-processor-role* and hit **Next**;
- frequency stays **On demand**;
- and finally we add a new database called *{choose-name}\_curated*

We return to the *Workflows* in the left side pane, select our created workflow and add one more trigger from the **Action** menu on the right.

- Select the **Add new** tab;
- Define the name as *"crawlers"*;
- Choose *Event* as *Trigger type*;
- Select *"Start after ALL watched event"* and click **Add**;
- Now select the newly created trigger in the workflow editor and click on the **Add jobs/crawlers to watch**. Select your jobs and hit **Add**.
- Select the **Add jobs/crawlers to trigger** option;
- This time select the **Crawlers** tab and check your curated crawler.

## Reviewing the results

**NOTE:** In your created workflow, it starts by executing the jobs. However, because there is always new data being added or updated in your raw folder, you should later add your created crawler in the very beginning as the trigger to your transformation jobs.

Once we are ready, we can try out the workflow by clicking on **Run** in the **Actions** menu.

Once you selected a job, you can monitor its execution status in the *History* TAB in the bottom panel; If the job(s) succeeded, visit the *Metrics* TAB to see resource utilisation and data movement information; Also note that the jobs can take quite a bit of time to end, about 15 minutes in total.

When jobs succeed you should find in your S3 bucket a folder called *curated* with subfolders for all your tables.

#### Workflows (1)

A workflow is an orchestration used to visualize and manage the relationship and execution of multiple triggers, jobs and crawlers.

The screenshot shows the Airflow web interface. At the top, there's a navigation bar with 'Add workflow', 'Actions', and a refresh icon. Below it is a search bar labeled 'Filter workflows'. The main table lists workflows with columns: Name, Last run, Last run status, and Last modified. The workflow 'sporttickets-wf' is listed with a status of 'Running'. Below the table, there are tabs for 'Graph', 'Details', and 'History'. The 'History' tab is selected, showing a list of runs with columns: Run ID, Run status, Execution time, and Start time. The latest run is highlighted, and a red arrow points to the 'View run details' button with the text 'Click to see the execution details'.

Name	Last run	Last run status	Last modified
sporttickets-wf	-	Running	Sat, 19 Oct 2019 23:44:29 GMT

Run ID	Run status	Execution time	Start time
wr_2c5eed95122cd3f7eb09c187d92505560000...	Running	-	Sun, 20 Oct 2019 11:40:14 GMT
wr_2778b610d84e630909020a40cfd0051e6935...	Completed	-	Sun, 20 Oct 2019 11:18:00 GMT
wr_d3d3e49aa0a9b3a007e446d0246a280acbe6...	Completed	19 Minutes	Sun, 20 Oct 2019 11:10:08 GMT
wr_c9cefd74ccd158b81ee8bc7254e5c8277ec8d...	Completed	5 Minutes	Sun, 20 Oct 2019 10:10:08 GMT

By selecting the latest Job and clicking on the **View run details** you can monitor the execution results of the data processing pipeline:

## Workflows (1)

A workflow is an orchestration used to visualize and manage the relationship and execution of multiple triggers, jobs and crawlers.

[Add workflow](#) [Actions](#) [Refresh](#)

	Name	Last run	Last run status	Last modified
	byod-dry-run	Fri, 06 Dec 2019 16:43:...	Completed	Fri, 08 Nov 2019 17:13:47 GM

[Graph](#) [Details](#) [History](#)

**Legend:** ● Start ◆ Trigger 📄 Job 🕸 Crawler ⚡ Incomplete ❌ Error ⌛ Deleting [Remove](#)

Once the pipeline succeeded at least once, we should be able to observe the newly created databases in the data catalog.

### AWS Glue

- Data catalog
